(Thomas LECLERCQ)

## ABSTRACT

ManiHome is a solution to find easily a flat/house in Manipal. It's a centralized mobile application where everyone can browse, add and view available accommodations and chat easily with the owner of this one. It's a first in the area, no existante solution is available and we offer a free alternative to brokers.

The system is a mobile application and a server that will contain the database. We built the mobile application using React-native library (node.js) and the server using Phoenix Framework (elixir)  
The source code is versionned on Github and is open-source.

Doing this project made me improve greatly my knowledge in mobile and server development in two different languages, it was a challenge to offer the best user interface on the application.

It was interesting to make a project that can be usefull to a large amount of people (students of manipal) and find a way to create a innovative product that have a real need. We choosed to not monetize the application but it would be fairly easy to make it rentable.

Tools used :

- versionning : git
- server hosting: linux
- mobile plateform: android
- continuous integration: travis-ci
- server framework : Phoenix - elixir
- application framework : React-Native (node.js)
- project managment: github - agile
